

Human authority, escalation and controlled recovery

Purpose

Keep report review separate from operational authorization and execution. The copilot assembles evidence and advisory guidance; the operator decides on the exact report. Approval/rejection does not execute or authorize remediation.

Incident Commander coordinates owner review. Stage, Platform and Security Owners remain responsible for separately authorized actions within their normal control boundaries. All actors, systems and operational records are fictional.

Document control	Value
Key / version	PL-105 / 1.0.0
Document ID	3bb18135-be1c-4a38-8737-72a24b1eab50
Owner	Incident Commander
Tenant ID	8b860d80-d17f-4e6b-8c48-af35f26a4d61
Status / effective	APPROVED / 2026-10-01
Approver	Knowledge Approver (fictional role)
Scope	cross-stage
Risks / sources	R24, R18, R21, R23 / E01, E10, E11

Synthetic notice: All systems, records, roles and amounts are fictional. Guidance is advisory and never executes an action.

Mandatory authority and recovery controls

Human report decision

An explicit attributable approval/rejection must bind to the exact immutable report and retain UTC timestamp and reason. Model content must not choose terminal workflow state, approve itself or trigger an irreversible action. A schema-valid report remains advisory; valid citations do not guarantee supported conclusions.

Operational authorization

Any separately controlled retry, replay, release, refund, configuration correction or projection repair must name the responsible owner, operation/change scope, preconditions, human authorization, validation checkpoint and rollback boundary. Advice must not imply that the action has already occurred. A generic instruction to fix the incident is not a bounded approval for a payment operation.

Original outcome and applicable policy must be established before recovery review. Unknown or conflicting records require source-owner clarification. Security controls must not be bypassed. Amount/idempotency prerequisites in PL-102 remain mandatory; a report decision cannot waive them.

Escalation and communication

Unresolved investigations must name the exact missing source, responsible owner, affected tenant/operation/window and distinguishing question. Incident Commander coordinates checkpoints without inventing severity, deadlines or regulatory claims. The copilot must not contact owners or external parties automatically.

Rollback plans must distinguish configuration/projection changes from completed downstream operations. A configuration rollback cannot undo a capture, refund, release or delivered event. Compensating operations require their own review.

Governance and verification

Responsibilities

Role	Authority boundary
Payment Operations Analyst	Review exact report, evidence and gaps; record attributable decision
Incident Commander	Coordinate owners, escalation and checkpoints; no blanket execution authority
Stage / Platform / Security Owner	Review separately controlled actions and their validation/rollback scope
Knowledge Approver	Review versions and changes without approving an incident report

Exceptions and audit

There is no automatic-action exception. A missing source, deadline or approval must remain unresolved rather than assumed. An unsafe recommendation requires human rejection/review with the original report retained; do not mutate history to make earlier advice compliant.

Retain model/prompt/evidence/retrieval metadata, exact report and human decision, owner authorization references where separately available, validation outcome and rollback limits. Never invent an action record to complete an audit timeline.

Review triggers and current capability

Review this policy when model/report behavior, source authority or controlled recovery procedures change. New execution capabilities would require a separate explicit decision; this package authorizes none. E10/E11 are future sources and current MCP is read-only aggregate evidence. Q6 LOW/null remains unchanged for degraded/empty report evidence. Fictional APPROVED document metadata identifies knowledge governance only, never the operator's terminal report decision.
