

Capture acknowledgement and amount checks

Use and preconditions

Investigate capture submission failures, missing confirmations or apparent amount breaches. Capture requires a confirmed authorization relationship; submission does not prove capture, and confirmed capture does not prove settlement.

The Capture Owner confirms stage results. The Authorization Owner supplies amount and hold history. No recapture or balance correction follows automatically from an error. All amounts use integer SYN_UNIT in the fictional domain.

Document control	Value
Key / version	RB-104 / 1.0.0
Document ID	56f911d1-ca67-46db-87d6-d46cf163e20e
Owner	Capture Owner
Tenant ID	8b860d80-d17f-4e6b-8c48-af35f26a4d61
Status / effective	APPROVED / 2026-10-01
Approver	Knowledge Approver (fictional role)
Scope	authorization, capture
Risks / sources	R05, R06, R07, R17 / E02, E03, E04, E05, E09, E10

Synthetic notice: All systems, records, roles and amounts are fictional. Guidance is advisory and never executes an action.

Reconstruct authorization and capture lineage

Procedure

Request E03 approval and E05 hold/expiry records linked to the E02 intent and request. Compare authorization amount and effective timing rule in E10. An absent expiry record cannot be replaced by elapsed local time. If approval or linkage is missing, record the precondition as unestablished rather than guessing failure.

Obtain E04 capture requests and final acknowledgements with operation IDs. List CONFIRMED, PENDING/UNKNOWN and explicitly FAILED operations separately. A local submission exception may coexist with downstream confirmation; do not recapture until that distinction is resolved.

Compute confirmed capture sum and unresolved exposure by distinct logical operations. Repeated acknowledgement delivery must not be counted twice. Compare confirmed plus pending exposure with the confirmed authorization amount. Reserve pending headroom; do not treat it as available simply because confirmation is late.

Alternative explanations

Symptom	Distinguishing check
Capture shown failed locally	E04 explicit downstream result versus local exception
Amount exceeds authorization	E03/E04 same scope, units and operation identity; remove repeated events only with identity proof
Capture appears after expiry	E05 confirmed expiry and E10 timing, not collection/arrival order
Capture missing from comparison	E09 snapshot completeness/cutoff versus actual absent confirmation

Conflicting final results or a confirmed invariant breach require owner review. Do not explain them away using split tender, incremental authorization or FX; those mechanisms are outside this synthetic domain.

Safe diagnostic and recovery direction

Conditional decisions

A confirmed capture should be retained even when the local request view failed. The owner may separately authorize projection reconciliation after confirming identity and audit scope. A confirmed failed capture may support controlled resubmission only after PL-102 preconditions, headroom and idempotency checks. Unknown results support an acknowledgement request, not a new-key retry.

For amount conflicts, the Capture Owner coordinates with the Lifecycle and Reconciliation Owners using RB-109. A refund is a separate linked operation, not an automatic correction to a failed comparison.

Validation and rollback boundary

After an authorized configuration/projection correction, compare original E04 acknowledgements, current projection and unchanged authorization history. Define the validation window and owner checkpoint. Rolling back configuration does not undo a confirmed capture; any recovery operation needs separate authorization, identity and final confirmation.

Retain approval/hold IDs, capture matrix, arithmetic, pending exposure, effective rule and missing records. Only aggregate service errors are available now; richer sources are future requirements. Incomplete evidence must remain visible and degraded/empty reports retain Q6 LOW/null cause and recommendation.
