

Settlement checkpoints and receipt gaps

Purpose

Investigate synthetic batch delays or disagreements between receipts and local batch status. A delayed checkpoint is a symptom, not proof of loss or failed bank movement. This system models no real transfers.

The Settlement Owner owns batch membership and receipts. Reconciliation Owner compares complete snapshots; Platform Owner supplies effective cutoffs and clock observations. No batch resubmission or balance change is authorized here.

Document control	Value

Synthetic notice: All systems, records, roles and amounts are fictional. Guidance is advisory and never executes an action.

Establish the expected checkpoint

Membership and timing

Request E07 batch identity, closure version, membership, submission record and any downstream receipt. Preserve OPEN versus CLOSED state: a changing open membership is not comparable with a closed receipt. Check E10's effective cutoff and expected checkpoint, including timezone interpretation. Missing configuration prevents an overdue conclusion; do not supply a conventional payment-network deadline.

Compare E04/E06 confirmed operation membership with E07, and obtain E09 snapshot coverage at the same cutoff. Separate a missing local receipt, a missing downstream confirmation and a membership mismatch. Event arrival order may differ from source order; E11 clock uncertainty must remain part of the comparison.

Interpretation table

Condition	Investigation direction
Batch still OPEN or not yet due	Confirm effective rule; do not classify checkpoint as failed
Submitted, receipt unavailable	Request exact batch confirmation; retain UNKNOWN outcome
Receipt confirmed, local status stale	Compare source/projection versions; no automatic resubmission
Comparable complete snapshots differ	Trace membership and operation lineage using RB-109

Negative checks include omitted pages, unsupported filters and changed closure versions. An empty receipt query outside retained scope is not evidence that the batch never completed. A receipt confirms its listed batch, not unlisted captures or later refunds. Contradictory receipts require source-owner review.

Controlled recovery and closure

Conditional direction

The Settlement Owner first recovers confirmation for the original batch. Advice to resubmit requires a known outcome, duplicate-protection review and a separately authorized procedure. Do not repeat submission solely because a local timer fired. For confirmed receipt/local projection disagreement, request reconciliation of the projection while preserving the receipt and closure identity.

Verification and escalation

Retain batch closure/version, exact membership digest or bounded list, receipt IDs, effective rule, comparable cutoffs and incomplete scopes. Ask for the smallest missing source that distinguishes delayed confirmation from actual failure. Escalate unresolved timing/record disagreement to Settlement and Platform Owners.

After an authorized correction, compare original membership and receipt with the new view, and check unrelated batches remain outside the change scope. A local configuration rollback cannot undo a confirmed synthetic settlement outcome; any successor operation remains separately attributable.

Current capability

Only aggregate service-error evidence is available via MCP. E04/E06/E07/E09-E11 are future source requirements. A report can identify missing checkpoint evidence but must not invent transfers, balances or deadlines. Q6 degraded/empty evidence continues to require LOW confidence and null cause/recommendation.
